

FASTENING STRUCTURE

Abstract

A fastening structure is mounted inside a power control box and includes two guiding sheets and a resilient stopper. When an adapter module is placed in the power control box, the guiding sheets guide the adapter module to move along a predetermined direction to a predetermined position. Then, a resilient stopper rebounds to abut against a back surface of the adapter module to fasten the adapter module. Furthermore, when a screw nut is screwed to the adapter module, the resilient stopper and the guiding sheets provide a fastening mechanism for the screw nut to be easily screwed.
